

One age, eighteen ways to group it

CDC and WHO programs cut age differently. Map every display from the exact age and unit that NNDSS and syndromic (ESSENCE) feeds send, never from another program's band.

Crosswalk v1.3.8
2026-09-25

1 • Capture

Exact age + unit (a, mo, wk, d, UNK) or birth + event date

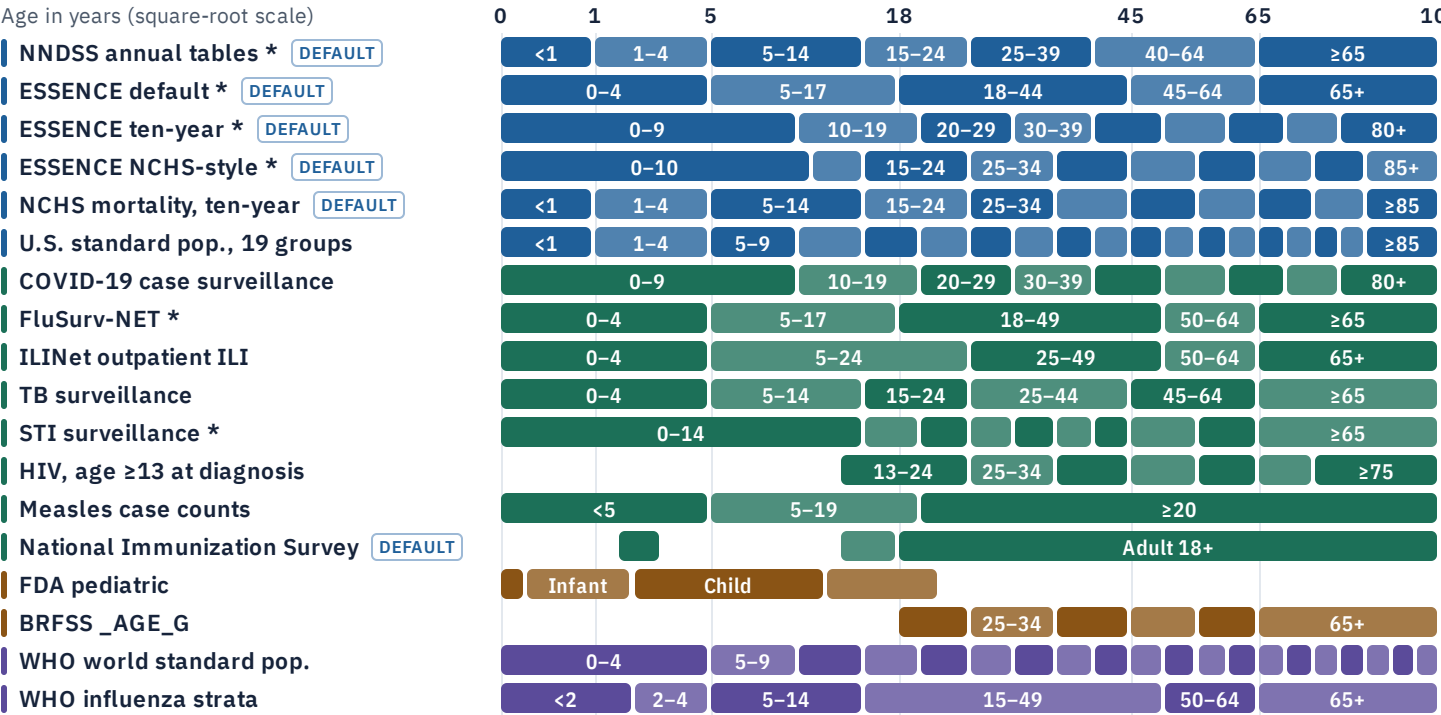

2 • Normalize

Completed years, months, days (1 y = 365.25 d)

3 • Map

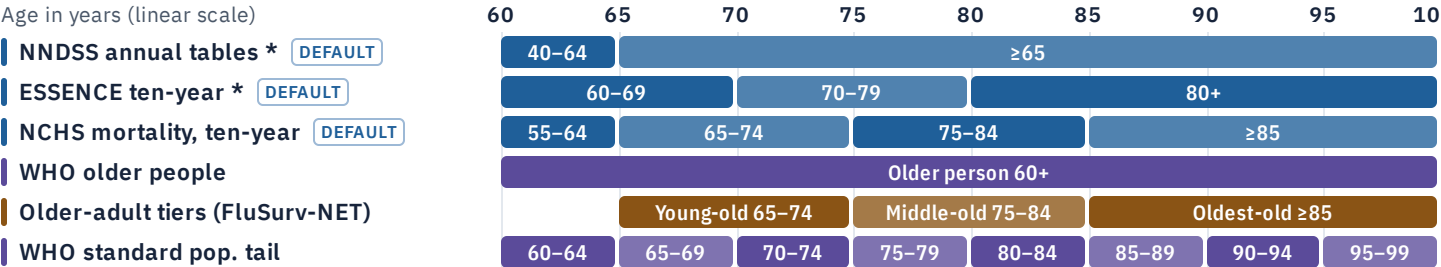

Lower bound inclusive, upper bound exclusive

All ages, 0–100 years

Square-root scale keeps infant bands visible. **DEFAULT** = preselected in the Age Group Mapper app. * Confirm before production use (report year or ESSENCE site setup).

Older adults, 60–100 years

WHO defines older people as 60+. Older-adult tiers follow FluSurv-NET analyses; the WHO standard population runs in 5-year bands to 100+.

Unknown vs. outside

Blank, UNK or OTH is Unknown. A known age no band covers is Outside scheme.

Partial and overlapping

HIV starts at 13, BRFSS at 18. WHO adolescent and youth bands overlap; never sum them.

Computable

Bands ship as data plus SQL, PySpark, Tableau, DAX and Excel logic, with 1,408 test cases.
